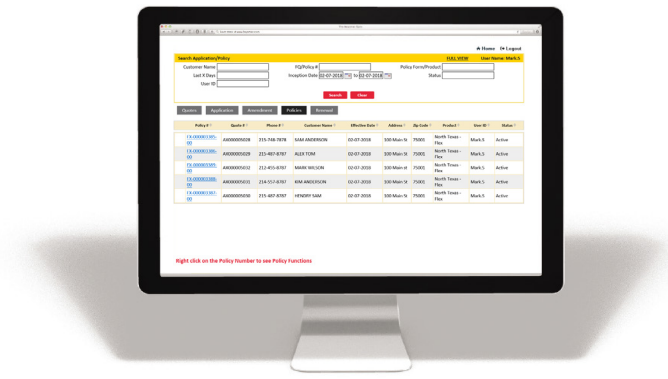
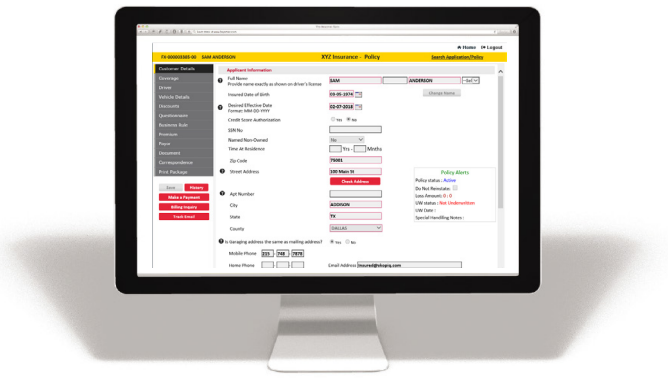
Your Processes, From Your Business Rules

Our pre-configured bots can be programmed to follow your business rules and processes precisely and automatically. For example, a bot can be programmed to find auto policies for which no photos have been submitted and to follow up with the agent and the policyholder. This saves considerable time on policy servicing follow up.

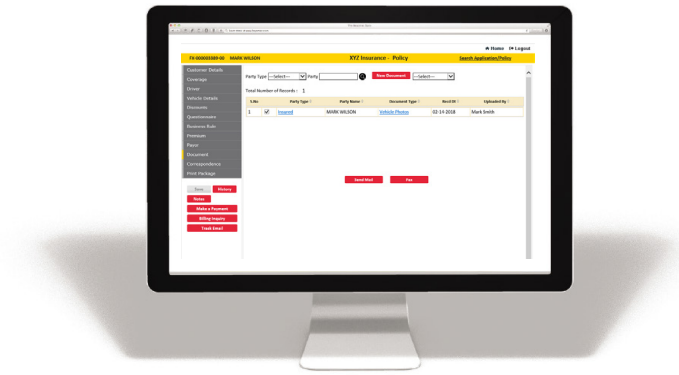
Step 1: The bot logs in to the policy system and enters a range of inception dates to query for policies for which images have not been provided.

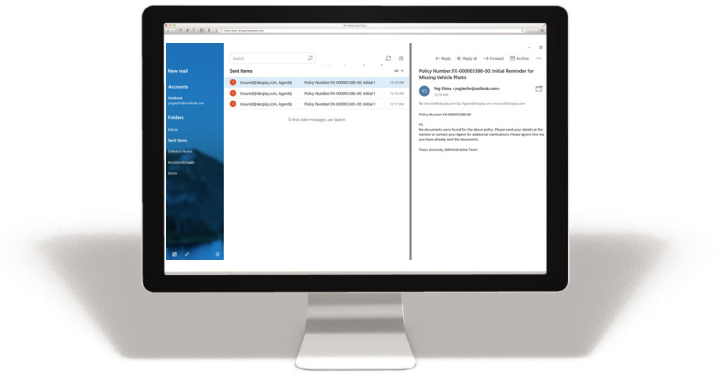
Step 2: The bot begins the process of reviewing all policiesfor which vehicle pictures have not been received within seven days of inception.





Continued >>





Step 3: Going through each policy, the bot checks to see if a photo has been appended to the file. If not, it sends a reminder email to the policyholder and the appropriate agent requesting a photo. It then repeats the process for every policy without pictures in the system.

Depending on the company's business rules, the bot will send follow-up reminders up for policies without photos within a pre-defined date range. If no photo is submitted by that date, the bot will either send a stronger email follow-up or cancel the policy, depending on your preferred process.

ROI = Real Operational Improvement

We have more than 25 pre-configured bots that automate processes for claims, billing, accounting, underwriting, and more. They provide faster response and resolution times. They yield increases in operational efficiency that exceed 60 percent with 100 percent accuracy. They provide scalability, reliability, and 24/7 availability. They help increase the satisfaction of policyholders and agents. They deploy in just four to six weeks. And most important, they provide ROI in three to six months.
